

Global Superstore Sales Performance Dashboard

Business Analysis Summary

Introduction

The purpose of this project was to analyze the performance of a global retail store using Power BI and PostgreSQL. The dashboard was developed to help identify which products, customer segments, and regions perform the best, as well as to understand how discounts affect profitability.

The analysis was based on the Global Superstore dataset and focused on answering several business questions that could help management make better decisions.

Business Question 1: Which product categories generate the most profit?

To answer this question, sales and profit were analyzed across different product categories and sub-categories.

Findings

The results showed that Technology is the most profitable category, generating approximately **\$0.66 million** in profit. Office Supplies generated around **\$0.52 million**, while Furniture produced the lowest profit at **\$0.29 million**.

Among the sub-categories, Copiers generated the highest profit, while Tables generated an overall loss.

Recommendation

The company should continue investing in Technology products because they provide the highest returns. Products that consistently generate losses, such as Tables, should be reviewed to determine whether pricing, discounting, or product selection needs improvement.

Business Question 2: Which customer segment performs best?

The dashboard compared sales, profit, and quantity sold across different customer segments.

Findings

The Consumer segment generated the highest sales revenue of approximately **\$6.5 million** and the highest profit of about **\$0.75 million**. The Corporate segment performed moderately, while the Home Office segment generated the lowest sales and profit.

Recommendation

The business should focus on retaining Consumer customers because they contribute the most value. Marketing campaigns and loyalty programs could help strengthen relationships with these customers. Additional efforts can also be made to increase sales within the Home Office segment.

Business Question 3: Which regions perform the best?

Regional performance was analyzed to determine which areas contribute the most sales and profit.

Findings

The Central region generated the highest profit, followed by the North and North Asia regions. The APAC market produced the highest sales overall. Some regions achieved strong sales but lower profit, which may indicate higher costs or less efficient operations.

Recommendation

The company should continue supporting high-performing regions and investigate why some regions have lower profit despite generating strong sales. Successful strategies used in profitable regions could be applied to weaker regions where possible.

Business Question 4: How do discounts affect profitability?

The relationship between discounts and profit was examined to understand whether higher discounts lead to better business performance.

Findings

Furniture received the highest average discount of approximately **16.8%**, but it remained the least profitable category. Several products generated losses even though they received large discounts. The analysis showed that higher discounts do not always result in higher profits.

Recommendation

The company should review its discount policies and avoid offering large discounts on products that already have low profit margins. Discounts should be used strategically rather than applied broadly across products.

Conclusion

The analysis showed that Technology products are the most profitable, Consumer customers generate the highest value, and the Central region performs best in terms of profit. The findings also revealed that large discounts do not necessarily improve profitability and can sometimes contribute to losses.

Overall, the dashboard provides useful insights that can help management make more informed decisions regarding products, customers, regions, and pricing strategies. By focusing on profitable products and customer segments while improving discount management, the company can improve its overall performance and profitability.

Summary of Recommendations

- Increase focus on Technology products and profitable sub-categories.
- Retain and grow the Consumer customer segment.
- Invest further in high-performing regions.
- Review underperforming products such as Tables.
- Reduce unnecessary discounting on low-profit products.
- Use dashboard insights to support future business decisions.
